

Heating

ACT gives you the possibility of installing Eberspacher D2 or D4 Airtronic air heaters with a capacity of 2200 or 3500W under the passenger seats. This unit operates on the basis of the engine fuel. Cold air is sucked out of the vehicle, heated and directed to the space chosen by the driver. As standard, a simple interface is installed on the dashboard, optionally we can install a digital timer or a remote control.

If the heating requires more power, a 7000W hot water system can be installed: Eberspacher D5 W SC Hydronic with Helios fan heaters.

Also here you can install a digital timer or a remote control. By doing this you can preheat the car before you go in, increasing the comfort level considerably.

Air conditioning

On the basis of a standard compressor, we can extend the air-conditioning system with an extra evaporator, mounted on the roof.

An extra condenser can be installed under the vehicle. An air channel (or two if there is an emergency exit) can be placed against the ceiling over its entire length.
