

## Hydraulic crane

Onto chassis cabs, ACT can install hydraulic cranes. They can be installed in the front or rear, integrated with the superstructure or between the superstructure and the cab. Stabilizers are manual or hydraulic.

We will engineer the necessary stiffness into the sub chassis, which will be bolted onto the original fixation points. If necessary, we will add supplementary fixation-points. The reinforced sub-chassis will additionally be hot dip galvanized to avoid corrosion.

### Possible hydraulic functions are:

- Lifting;
- Extension of one or more of the arms;
- Rotation of the crane;
- Placement of stabilizers;
- The rotation of the hook;
- Radio controlled command;
